PROJECT PROPOSAL

1. Project Title

AutoCare: Interactive Vehicle Service & Maintenance Management System

2. Summary of the Project

Vehicle maintenance and service booking are essential tasks for vehicle owners. However, traditional over-the-counter booking often leads to long wait times, scheduling conflicts, and inefficient tracking of service histories.

AutoCare is designed to streamline the vehicle maintenance lifecycle by providing a centralized web platform. Vehicle owners can seamlessly explore available services, schedule service appointments, and manage their personal profiles. Concurrently, service center management can monitor requests and efficiently manage operational workflows through an admin control interface.

3. Project Objectives

- To design a user-friendly and responsive interface for hassle-free vehicle service discovery and appointment booking.
- To implement a structured user onboarding and authentication workflow with client-side verification and error handling.
- To provide customers with a personalized dashboard for viewing and managing their account profiles and booking records.
- To build a centralized administrative dashboard for managing service requests and maintaining real-time operational status updates.

4. Key Features & Work Distribution (4 Core Modules)

To ensure seamless coordination and equal balance of workload among all four team members, the system is divided into four distinct operational modules:

Module 1: User Onboarding & Registration System

Core Features:

- Interactive Registration Form (Full Name, Email, Phone Number, Vehicle Model/Type, Password, etc.).
- Modal popup for Terms & Conditions and Usage Policies.
- Interactive password visibility toggle (Show/Hide password).

Module 2: Customer Authentication & Support Module

Core Features:

- Secure Customer Login interface with input validation for empty fields and valid syntax.
- Simulated "Forgot Password" workflow featuring interactive OTP verification modal and reset interface.
- Interactive feedback notifications.
- Emergency roadside support and query submission section.

Module 3: Service Catalog & Appointment Booking System

Core Features:

- Dynamic Service Catalog grid displaying available service offerings (e.g., Engine Tuning, Oil Change, Wash & Polish, Brake Inspection, etc.) along with pricing details.
- Real-time live search bar and category filtering to quickly locate specific services.
- Appointment booking interface with integrated date-time slot pickers and date restriction logic.
- Interactive booking confirmation modal displaying a summary of the requested service appointment.

Module 4: Admin Operations Panel

Core Features:

- Overview analytical cards showing counts for total bookings, pending requests, and completed services.
- Master Booking Management Table displaying all incoming customer service requests.
- Interactive status toggles allowing administrators to approve, complete, or reject requests with dynamic status badge updates.
- Real-time table search and filtering tool for administrative record management.

5. Expected Outcomes

- A fully functional, responsive, and cohesive multi-page web application for vehicle service management.
- A clear operational workflow connecting customer registration, authentication, service discovery, booking execution, and administrative oversight.
- Enhanced user experience featuring real-time client-side feedback, form validation, dynamic search filters, and status toggles.
